

Total Profit by Date (Dollars)

Total Revenue by Concession Item

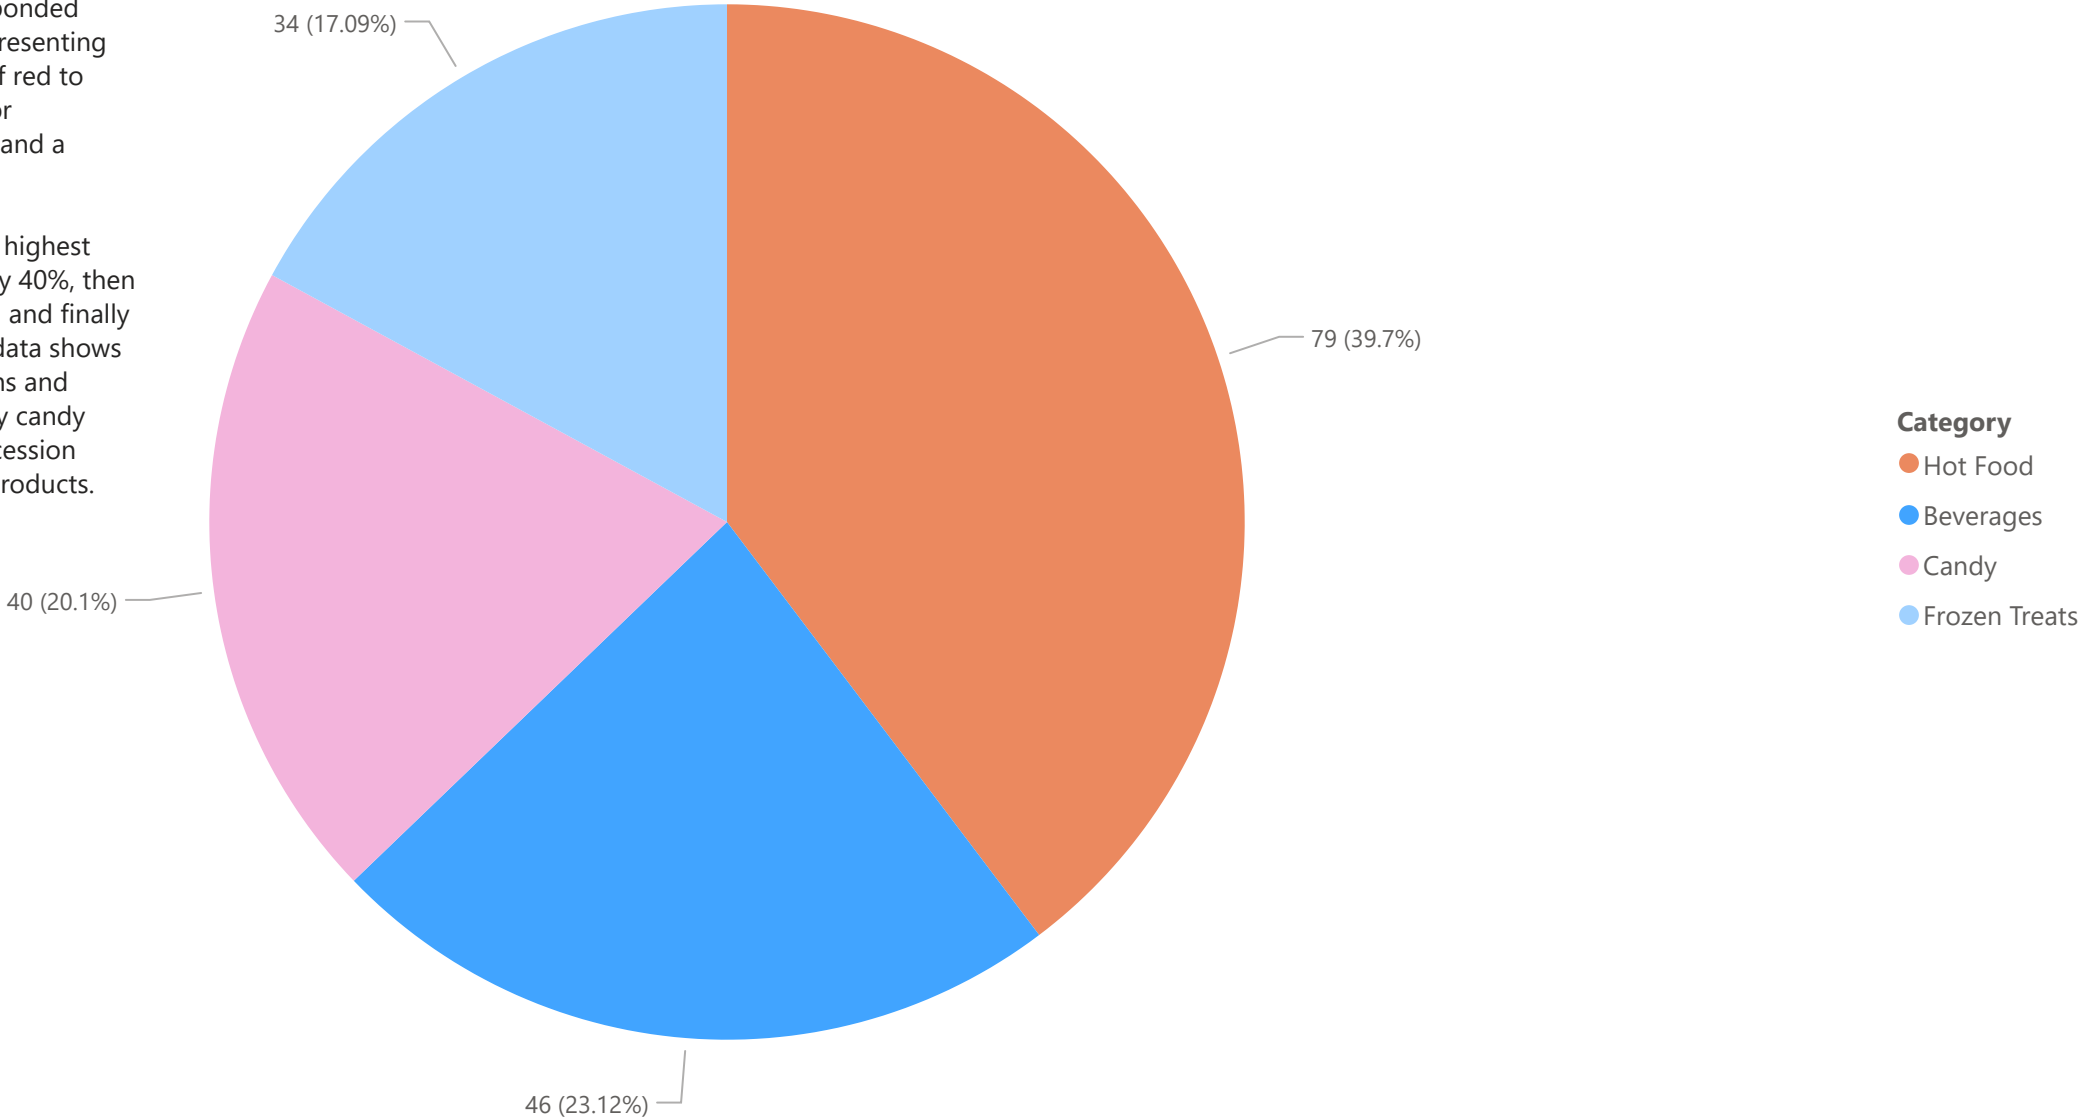

For my second visualization, I decided to use a bar graph to display the total revenue generated from each individual concession item from the Revenue by Item table in the Excel dataset. At first, I was going to use a pie chart for this visualization, but the information became too visually clunky and I decided that a bar graph was far more visually pleasing from this type of data. I adjusted the scale to fit the data, deleted the x-axis title since the data labels were suffice, and centered the bar graph's title. I also added data labels to each bar for ease of information, and I also displayed the bars in decreasing order of total revenue for a more pleasing visual layout. For the color scheme, I changed every other bar to a different color-blind friendly color. This creates color contrast for color-blind people while also creating consistency and variety from a graphic artist's perspective.

The data is pretty intuitive, showing the total revenue given by each concession item. Beer and popcorn generated the most revenue at 80 dollars while chocolate bars, licorice ropes, and hot dogs generated the least revenue at 26, 26, and 23 dollars, respectively.

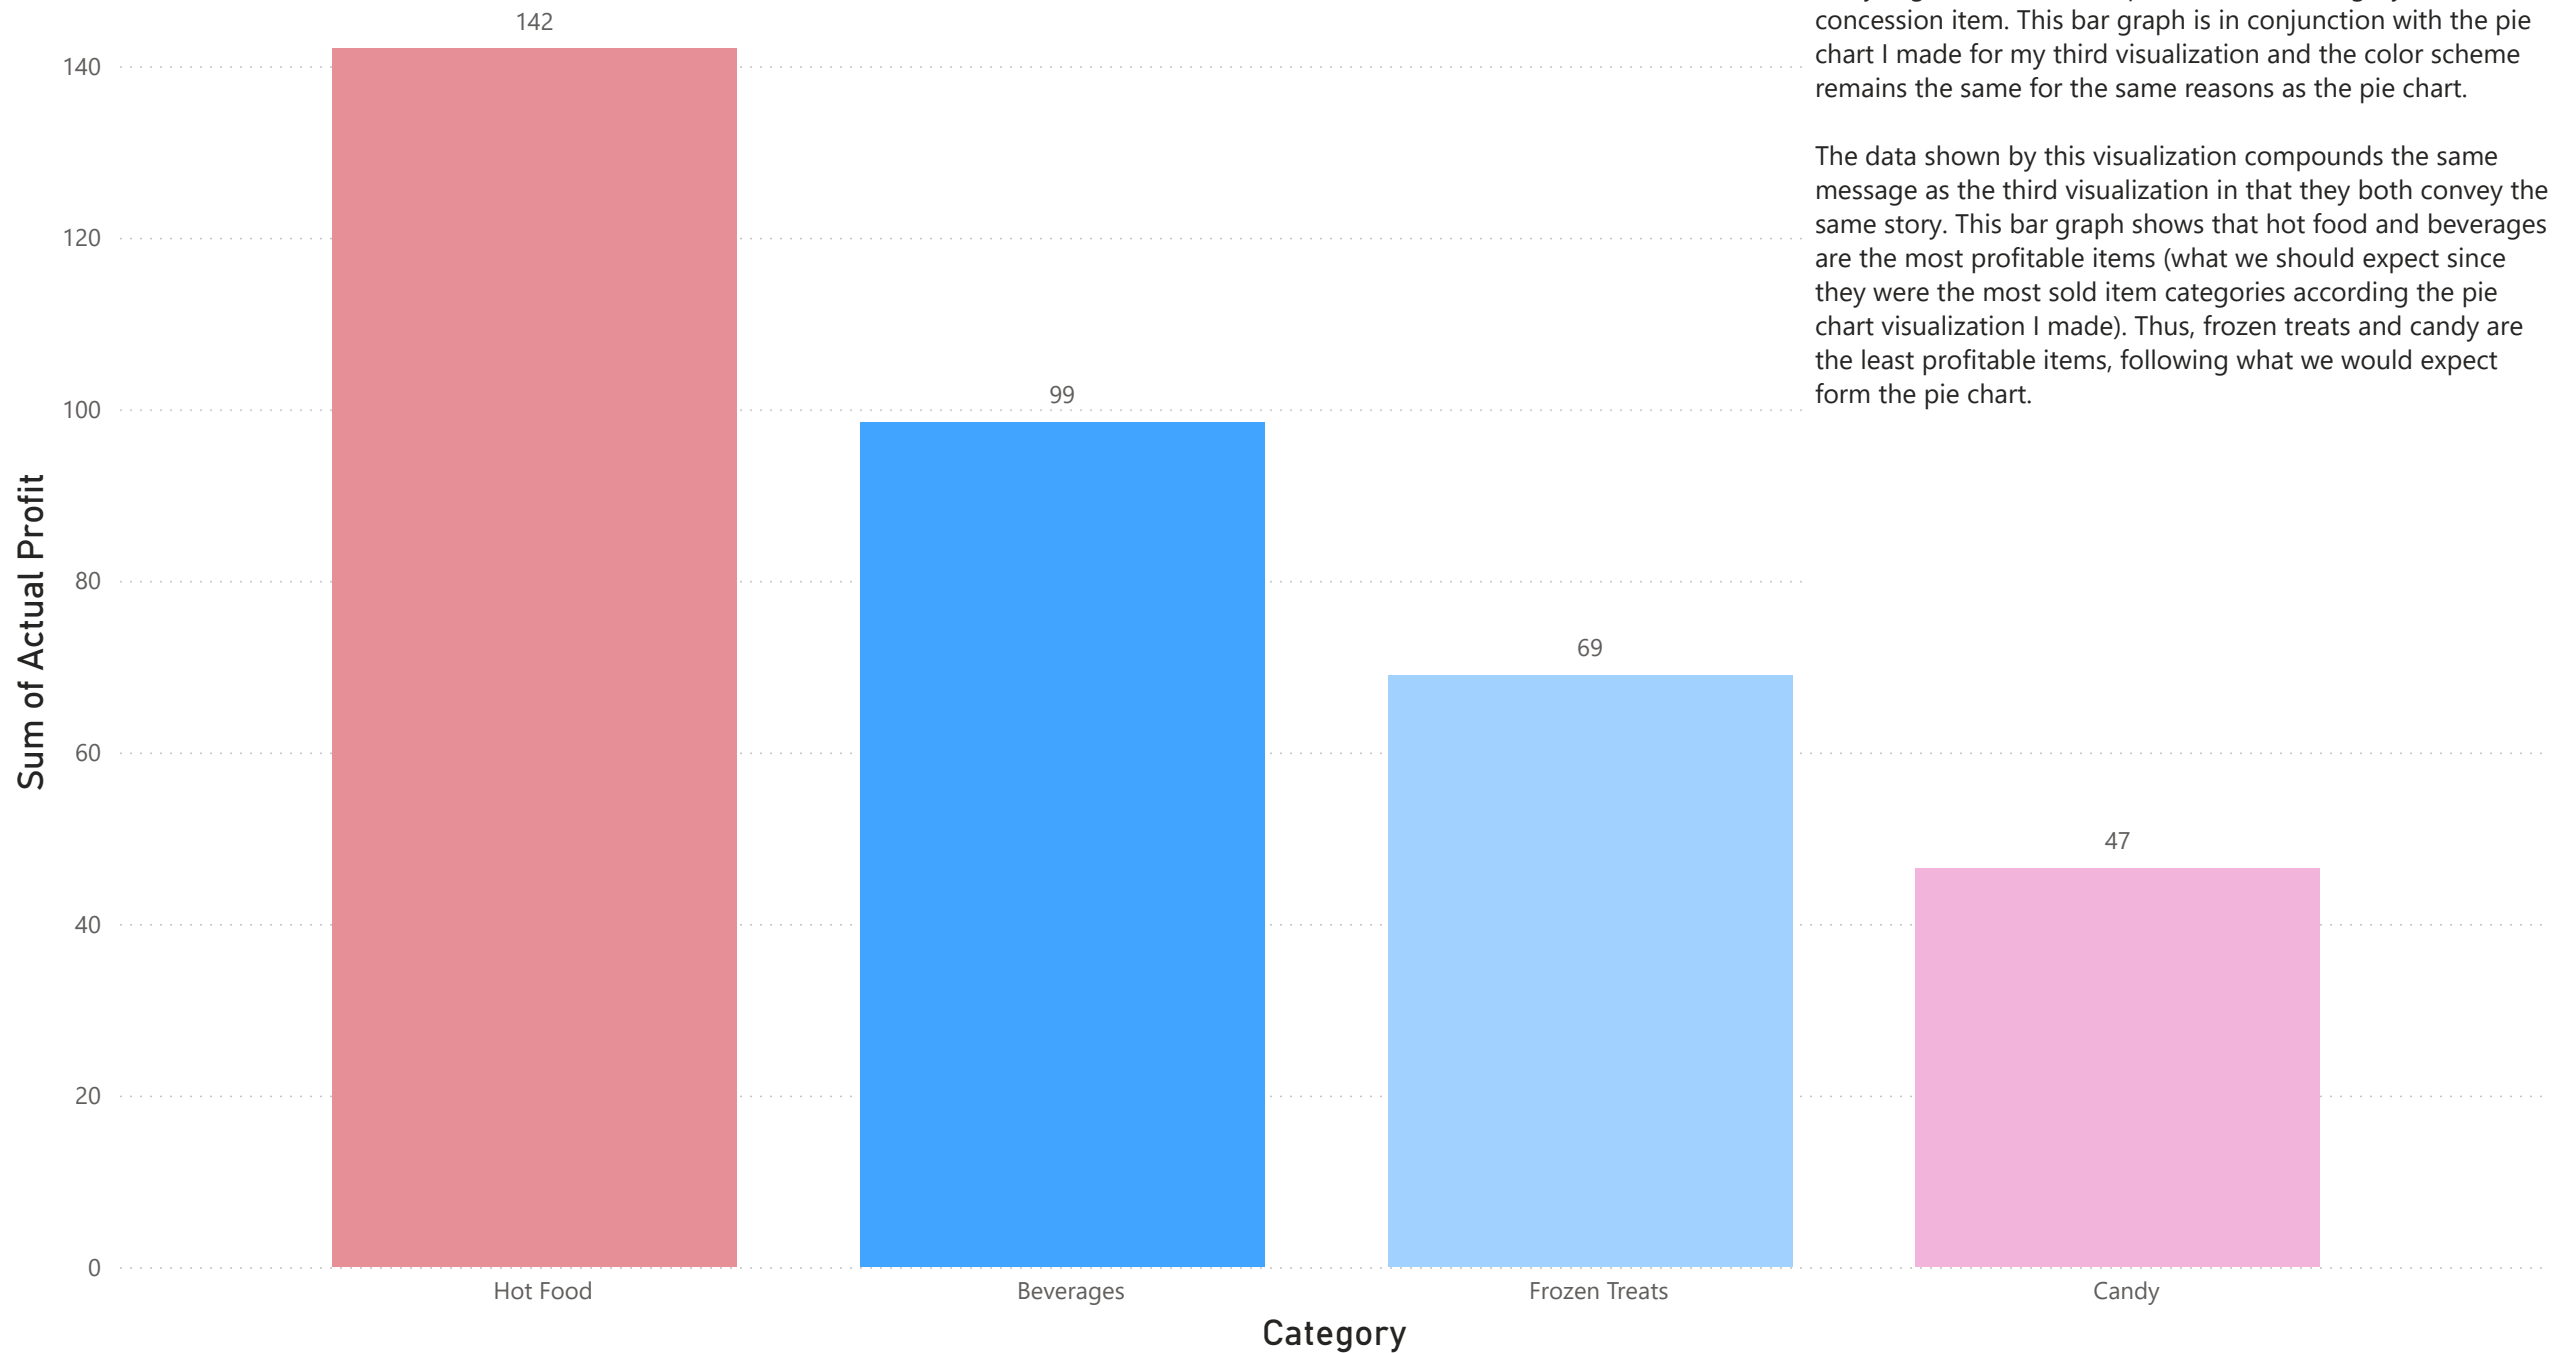

Percentage of Sales from Concession Categories

For my third visualization, I decided to use a pie chart to analyze the percentage of the count of total concession sales by item category. A pie chart easily visually conveys to the user how the size of each slice of the pie corresponds to the its percentage of the total pie. For the colors, I tried to use varying colors that also corresponded visually to the category they were representing for an extra visual element. A shade of red to represent hot food, a shade of blue for beverages, a shade of pink for candy, and a shade of light blue for frozen treats.

The data shows the category with the highest count of sales being hot food at nearly 40%, then beverages at 23%, then candy at 20%, and finally frozen treats the least with 17%. The data shows that people tend to buy hot food items and beverages more than they tend to buy candy and frozen treats and maybe the concession stand should invest more into these products.

Total Profit by Concession Category

For my last visualization, I decided to make a bar graph analyzing the sum of total profit for each category of concession item. This bar graph is in conjunction with the pie chart I made for my third visualization and the color scheme remains the same for the same reasons as the pie chart.

The data shown by this visualization compounds the same message as the third visualization in that they both convey the same story. This bar graph shows that hot food and beverages are the most profitable items (what we should expect since they were the most sold item categories according the pie chart visualization I made). Thus, frozen treats and candy are the least profitable items, following what we would expect from the pie chart.
