EVE Online Market Order Snapshots

What it is: A daily snapshot of every active buy and sell order across all regions in EVE

Online's player-driven marketplace. Eve is an online massively multiplayer online game set in space, where players take over space systems and interact in an online marketplace driven by the game's economy.

Data Dictionary:

- orderID (unique ID per order)
- typeID (unique ID item type)
- regionID (unique ID market region)
- stationID (where the order sits)
- price (price per-unit of the order)
- volumeRemain & volumeTotal (of the order)
- minVolume (minimum lot size per transaction)
- isBuyOrder (buy vs. sell flag)
- duration (how long the order has been active in days)
- issued (timestamp of when the order was issued)

Data Assessment:**Criterion Finding**

- The dataset contains about 1.5 million rows. Plenty of scale to stress-test downstream pipelines.
1. **High Volume**
- issued timestamps span from 2025-04-12 through 2025-07-12, giving an extensive 3 months of order-history context.
2. **Timely**
- 16 columns covering IDs, numerics, booleans, and timestamps.
3. **Multivariate**
- No fields contain internal delimiters—every cell is a single, indivisible datum (IDs are integers, price/volume are floats/ints, flags are booleans).
4. **Atomic**
- Most columns have complete data and no missing values. The `station_id` column has about 25k missing values, while the `system_id` and `constellation_id` have 110 missing values, respectively.
5. **Complete**
- `orderID` is globally unique: 0 duplicates.
6. **Consistent**
- price ranges from 0.01 ISK (in-game currency) up to 1,500,000 ISK—all within expected game-economy bounds, no negative or zero-price anomalies.
7. **Valid**
- Buy vs. sell orders are both substantial, giving a good representation of both sides of the economy.
8. **Representative**
